

AHMC SFP IR MOA

Talos HMR Riflescope

SECOND FOCAL PLANE

RETICLE MANUAL

THE ATHLON® AHMC SFP IR MOA RETICLE

AHMC SFP IR MOA is a traditional hunting style reticle with an illuminated center-dot. The outside crosshair is bold, and prominently stands out against backgrounds that are tough to differentiate. It tapers down to a fine crosshair with a floating center-dot to reduce target obstruction, while drawing your eye to the center of the reticle.

For 3-12x50 reticle subtension is valid at 12x.

For 4-16x56 reticle subtension is valid at 16x.

Application: Hunting and Tactical

RETICLE SUBTENSIONS

The AHMC SFP IR MOA reticle is based on the minute of angle, a unit of angular measurement, usually shortened to moa. A "moa" is defined as "one minute of an angle". As a full circle has 360 degrees, and each degree is composed of 60 minutes (60'). thus there are 360 (degrees) x 60 (minutes) = 21,600 minutes in a circle. Since there are 360 degree in a circle, we can get $360 \text{ degree} / 21600 \text{ minutes} = 0.016667 \text{ degrees/minute}$. If the target is 100 yards (3600 inches) away, we can use a formula, $3600 * \text{TAN}(\text{RADIANS}(0.016667))$, to get 1.047 inches which means 1 moa equals to 1.047 inches at 100 yards. Many people just round down the 1.047 inches to 1 inch @100 yards. If you are using metric system, formula $100000\text{mm} * \text{TAN}(\text{RADIANS}(0.01667))$ gets you that 1 moa equals to 29.1 mm @100 meters.

The AHMC SFP IR MOA reticle is located at the second plane which stays in between erector tube and ocular lens. The size or the appearance of a second focal plane reticle does not change when you zoom in or zoom out, however the relative ratio between reticle and your target changes all the time because your target appears bigger or smaller when the magnification changes.
